

**IN THE ABSTRACT:**

Please replace the paragraph beginning at page 27, line 5, with the following rewritten paragraph:

1       A method for providing context save and restore using a test scan chain  
2 ~~multi-channel functionality with a telecommunication device (10) comprising a~~  
3 ~~single-channel~~ is provided. The method includes dividing a scan chain (34) of  
4 digital logic components (24) into a plurality of sub-chains (42). A first data set is  
5 provided in the sub-chains (42). The sub-chains (42) are linked in parallel and to  
6 a hardware resource for executing an application. The sub-chains (42) are  
7 linked to a device memory (18). A first application is executed to update the first  
8 data set in the sub-chains (42). The first application is operable to use the  
9 hardware resource ~~channel~~. The updated first data set is stored in the device  
10 memory (18). A second data set is restored from the device memory (18) to the  
11 sub-chains (42). A second application is executed to update the second data set  
12 in the sub-chains (42). The second application is operable to use the hardware  
13 resource ~~channel~~.
